General Instrument Inspection Guidelines

Surgical Instruments

Visually inspect the instrument surface. The surface should be clean, smooth and free from staining, crevices, rough spots and grinding marks (which could provide an opportunity for corrosion and also harbor bacteria). Carefully examine the tips of the instrument, blades, handles, box locks, alignment and working mechanism of the instrument.

Tungsten Carbide Instruments

Tungsten carbide inserts should not have any gaps or holes in the solder that could collect surgical debris that might lead to corrosion and pitting. The insert seam should be almost invisible.

Ratcheted Instruments

Ratchets should be beveled so there are no sharp edges. They should be smooth and clean. The ratchets should lock and unlock easily without excessive force.

***Please visit www.aesculapUSA.com for specific information on inspecting, cleaning and Instructions for Use.**

Scissors

- To test the sharpness and proper alignment of scissors, make a cut using the distal two thirds of scissor blades. The scissors should cut to the tip and the cut should be smooth with no drag.
- Open the scissors. Holding onto the bottom ring of the scissors, drop the top ring. The distal tips of the blades should remain 1/2 to 1/3 open. If the blade closes completely, the scissors are too loose. If it closes less than halfway, the scissors are too tight.

Needle Holders

- The jaws should touch when closed and holding a needle. If the ratchets do not engage, excessive pressure will be placed on the jaws when grasping a suture needle. This condition could lead to metal fatigue and stress crack failure.
- Hold the needle holder up to the light. You should not see light through the serrations, with the jaws closed and touching.
- Close the jaws on a piece of tin foil. You should see an even "mesh" pattern, with no gaps or pinholes.
- The needle holder should have easy, even movement at every position.

Hemostats and Cardiovascular Clamps

- Close a standard hemostat clamp. The jaws should touch on the first ratchet; in addition, the jaws should close tighter as the clamp is being closed on the last ratchet.
- Vascular clamps need more ratchets than other instruments in order to allow the surgeon precise controlled occlusion. A properly adjusted clamp should have the distal tips touching when the instrument is closed to the middle ratchet.
- The instrument should have a flexible feel to it when being locked and unlocked. Hold onto the top ring handle and drop the bottom ring. The handle should not swing freely, but move with minimal effort.
- It is important to check the box lock and verify that there is no "play" in the box lock. This is especially critical on long CV clamps because a little movement in the box lock becomes significantly more movement at the tip of the jaw. This could lead to improper meshing of the teeth and potential tearing of delicate vessels because of the movement in the alignment of the jaws.

Rongeurs and Kerrisons

- A properly sharpened Kerrison should cut a business card cleanly or leave an even indentation. Due to the variety of business cards and the materials used in making them, the thickness may vary. When using a thick business card, a clean cut may not be achieved and an even indentation will indicate a sharp instrument.
- Squeeze the Kerrison handle closed. The action should be smooth with no grinding or catching. When closed, the moving shaft should touch the foot plate, not traveling too far, causing stress to the foot plate.
- The Kerrison handle should spring back quickly when released. If the instrument does not spring back, check to make sure the instrument has been properly cleaned and lubricated.
- Hold the Kerrison up to the light in the closed position. The jaws of the instrument should meet precisely to assure proper function (no light should shine through the jaws).
- Intervertebral disc rongeurs should grasp a hair firmly and cut it cleanly. The jaws should meet precisely and should always be sharpened from the inside of the jaws (not ground or filed from outside) to maintain proper cutting alignment.
- Double action bone rongeurs should be free of play in the shanks and jaws.

Curettes

- The cup profile should be flat across the top without nicks or gouges.
- A properly sharpened curette, when scraped against a piece of plastic, should plane off "ribbons" of plastic.
- The cup should always be sharpened from the inside to the outside edge.

Care and Maintenance of Surgical Instruments

Treatment of New Instruments

Brand new instruments must be cleaned before the first sterilization or use.

Protective caps and protective films must be removed completely, especially for chisels, raspatories or microsurgical instruments.

Care/Testing

- Lubricate movable parts (e.g. joints and ends) slightly with special sterilization-capable, vapor-permeable lubricant (e.g. Aesculap STERILIT Spray JG 600 or Lubricant JG 598).
- After each cleaning and disinfection process, check the instrument to make sure it is clean, it functions properly and it has not suffered any damage, (e.g. bent, stained, broken, fractured or worn parts).
- Do not use defective or nonfunctioning instruments. Evaluation and repair can be performed by Aesculap Technical Service.
- Discard nonrepairable instruments.
- Sharpen (if appropriate) and maintain instruments on a regular schedule.

Storage

- Place instruments with fine working ends and/or microsurgery instruments in a suitable storage rack.

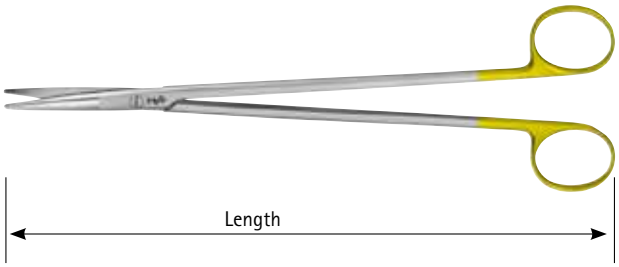

Illustration 2:

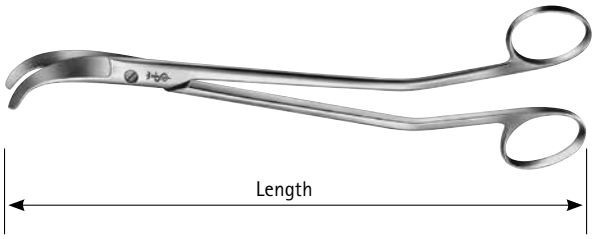

Instrument Length:

To measure the total length of an instrument, start at the bottom of the instrument and measure to the farthest tip in a straight line (*Illustration 1*).

For curved and angled instruments, the distance of a perpendicular line drawn from the bottom of the instrument to the farthest point will determine the overall instrument length (*Illustration 2*).

Illustration 3:

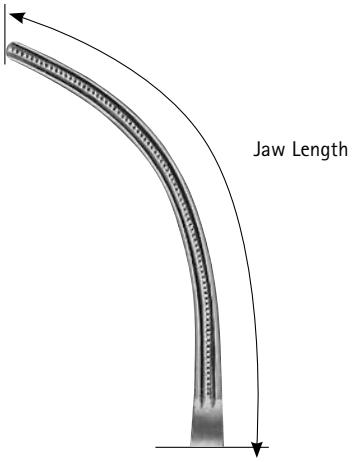

Illustration 4:

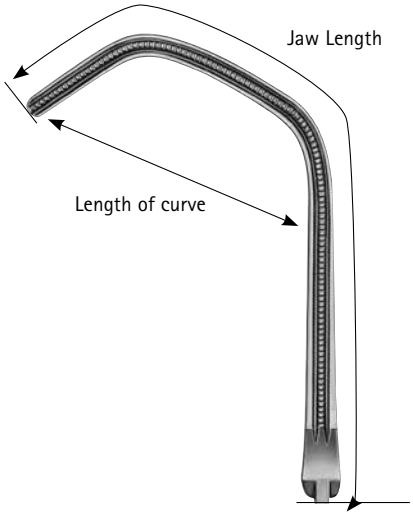

Jaw:

The jaw length of a clamp is measured from the beginning of the jaw to the bottom of the serrations (*Illustration 3*). For partial occlusion clamps, see *Illustration 4*.

Wavecut

Noir Supreme Cut Scissors

- Noir
  The combination of the renowned Aesculap Tungsten Carbide technology with the Aesculap Noir coating results in an extremely high surface hardness and therefore high wear resistance in daily hospital use.
- Microtome edge
  The extremely sharp cutting edge of the scissors blade facilitates gentle cutting of tissue with minimal use of force.
- Wavecut prevents tissue from slipping out during the cutting process.
- The WB after the item number indicates the Noir scissors are the wavecut style, e.g. BC211WB.

Titanium Micro Needle Holders

Aesculap Titanium Micro Instruments

- The extremely light Titanium material is an advantage for lengthy cardiac and vascular operations. This helps to carry on operating over longer time periods with minimum fatigue.
- The non-magnetic material makes working with particularly fine needles easier for you.
- Non-reflecting surface finish.
- Incomparable operating sensitivity: the Aesculap golf ball handle design.
- Unmistakable identification: the Aesculap color code.

For more information about Titanium Micro Instruments see our brochure number DOC890.

All needle holder jaws are coated with Aesculap Dia Dust™ diamond dust coating. This coating ensures that the inner surfaces provide the best possible performance in hardness and wear resistance. The texture of the jaws greatly increases its surface area, allowing you to grasp fine needles, sutures and soft tissue safely and securely. The needle quickly aligns itself in an ideal position in the rough surface. This results in a perfect grip that quite simply prevents any needle slippage.

Aesculap Titanium Micro Instruments

- The extremely light Titanium material is an advantage for lengthy cardiac and vascular operations. This helps to carry on operating over longer time periods with minimum fatigue.
- Non-reflecting surface finish - for optimal glare reduction.
- The Aesculap golf ball handle design - gives incomparable operating sensitivity.
- The Aesculap color code - provides unmistakable instrument identification.

For more information about Titanium Micro Instruments see our brochure number **DOC890**.

All titanium forceps jaws are coated with Aesculap Dia Dust™ diamond dust coating. This coating ensures that the inner surfaces provide the best possible performance in hardness and wear resistance. The texture of the jaws greatly increases its surface area, allowing you to grasp sutures and soft tissue safely and securely.

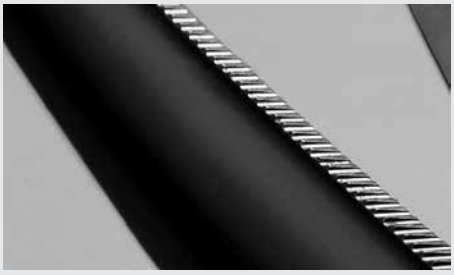
Microtome Edge



Wavecut

Noir Supreme Cut Scissors

- Noir
  The combination of the renowned Aesculap Tungsten Carbide technology with the Aesculap Noir coating results in an extremely high surface hardness and therefore high wear resistance in daily hospital use.
- Microtome edge
  The extremely sharp cutting edge of the scissors blade facilitates gentle cutting of tissue with minimal use of force.
- Wavecut helps prevent tissue from slipping out during the cutting process.
- The WB after the item number indicates the Noir scissors are the wavecut style, e.g. BC211WB.

Aesculap Ball Snap System on Spreaders and Blades

Advantages:
- Blades are safely locked without additional fixation, preventing them from detaching when the instrument is passed to the surgeon. In addition, the smooth surface minimizes the risk of catching a suture.
- Blades can be quickly exchanged during the operation.
- Different retractor patterns can be combined and exchanged at random, which allows for optimum selection of the blade size according to surgical needs.

- Complete retraction system consisting of a retractor body, various blade configurations, and storage tray. Designed to enable less invasive spine procedures such as discectomies and decompressions.
- Unique organization system enables easy storage and retrieval of desired blade.
- Sturdy design provides rigid retraction even at large opening widths.

All retractor components are titanium. Blade designs improve visualization and intra-operative imaging.

Non-Irrigating Bipolar Forceps

Bayonet Forceps, Rose Gold, Insulated

- Rose Gold plated tips reduce tissue adhesion

Non-Stick Rose Gold forceps
The Rose Gold forceps enable heat to be quickly discharged away from the tip.

Standard forceps
The heat cannot be discharged fast enough. This leads to overheating and sticking of tissue.

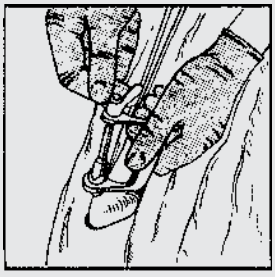
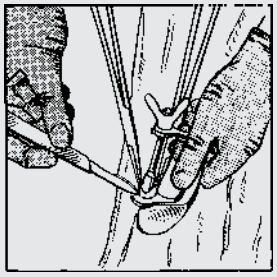
WINKELMANN Circumcision Clamp

Catalog Number	Diameter (mm)
EF965R	12
EF966R	16
EF967R	20





Assisted by two hemostats or ligatures the foreskin is pushed over the bell-shaped protection rod and the glans is placed into it. Next, the wing-nut is tightened as close as possible, so the foreskin is annular compressed. The foreskin is cut off with a scalpel adjacent to the compression ring. The circumcision clamp remains in place for a few minutes to avoid bleeding. If any large vein, specially the frenular artery, is cut, a ligature must be set. The advantage of the method described is the cosmetically favorable scar which is left after rejection of the small necrotized portion.
